MAILBOUNCE

NAME

MailBounce -- Open a new Write window to bounce the current message. (V2.0)

TEMPLATE

VAR/K,STEM/K,QUIET/S

FUNCTION

Opens a cut-down Write window to bounce the current message to another recipient.

INPUTS

`VAR/K` - alternative variable to store the number of the created window instead of RESULT
`STEM/K` - base name used for the stem where the returned data will be stored
`QUIET/S` - force the window to stay invisible (V2.1)

RETURNS

`<STEM>WINDOW` - number of the created window if the command had success; may be 0 or 1 (or 2, if QUIET is enabled)

`RC` is set to 10 if the window cannot be opened, maybe because the limit of two Write windows has been reached.

NOTES

In the outgoing message, only the "To:" field can be edited.

EXAMPLE

```
/* Silently bounce the current message */
MAILBOUNCE QUIET
WRITETO 'joe@example.com' 'mars'
WRITESEND
```
