

NEWMAILFILE

NAME

NewMailFile -- Return a valid, but unused message filename for a folder. (V2.0)

TEMPLATE

VAR/K,STEM/K,FOLDER

FUNCTION

Returns a valid but still unused message filename for a folder, based on the current date. This is the filename that YAM will use when adding the next message to this folder.

INPUTS

VAR/K - alternative variable to put the results into instead of RESULT

STEM/K - base name used for the stem where the filename will be returned

FOLDER - optional, name or number of the folder; if none is supplied, the current folder will be used

RETURNS

VAR - filename returned, with path

<STEM>FILENAME - filename returned, with path

RC is set to 10 if the specified folder doesn't exist or a group is currently selected.

NOTES

The command works by trying to lock the first message slot usable for the current date (e.g. Work:YAM/folder_name/09097.001 for Nov 28, 2002) and then working from there until the lock fails.
