

READCLOSE

NAME

ReadClose -- Close the active Read window. (V2.0)

TEMPLATE

FUNCTION

Closes the active Read window as set by MAILREAD ?.

INPUTS

RETURNS

RC is set to 10 if no Read window was previously specified as "active" with MAILREAD ?.

NOTES

EXAMPLE

BUGS

The command used to blindly act upon the first Read window opened at any given time; this was changed in V2.4 to require the use of MAILREAD ? to explicitly mark a window as "active".
