

## READCLOSE

### NAME

ReadClose -- Close the active Read window. (V2.0)

### TEMPLATE

### FUNCTION

Closes the active Read window as set by [MAILREAD ?](#).

### INPUTS

### RETURNS

RC is set to 10 if no Read window was previously specified as "active" with [MAILREAD ?](#).

### NOTES

### EXAMPLE

### BUGS

The command used to blindly act upon the first Read window opened at any given time; this was changed in V2.4 to require the use of [MAILREAD ?](#) to explicitly mark a window as "active".

### SEE ALSO

[MAILREAD ?](#)
