## Reference - ARexx interface

With the help of ARexx scripts, you can add new functions to YAM or let it do things automatically.

YAM offers a set of commands (listed in this documentation both [by name ?](#) and [by function ?](#)) which can be called through the **YAM** ARexx port. They are explained along the following subchapters using the following format:

### NAME

The name of the command, a short description of what it does and the YAM version where the command was implemented.

### TEMPLATE

Arguments and options accepted by the command. The template uses special characters that indicate the particular type of argument expected, following the AmigaDOS template style:

- /A The parameter is compulsory
- /K The parameter must be preceeded by the keyword
- /N Numerical argument or result
- /M Argument or result is a list of zero or more elements
- /S The parameter works as a switch; the switch is in use when the parameter is given

### FUNCTION

Describes what the command will do.

### INPUTS

Describes in detail the parameters accepted by the command. Be careful when passing arguments containing spaces; for instance,

```
sub = 'Hello World'
'WRITESUBJECT' sub
```

won't work. It must be written as

```
'WRITESUBJECT "'sub'"'
```

or

```
'WRITESUBJECT "Hello World"'
```

Please note that because of the internal use of the ReadArgs() function, the ARexx Host requires to escape certain special characters like a newline (0x0a) or escape character (0x1b) if you want to have it included in your final string or otherwise it is stripped by the ReadArgs() function.

This means that you have to use the following escape sequences in your provided strings:

- \*N substitutes to 0x0a (newline \n)
- \*E substitutes to 0x1b (escape)
- !\*\* substitutes to \*
- \* substitutes to "

For example the following command would write a string to a texteditor containing a newline:

```
'WRITEEDITOR "TEXT Hello Joe,*N I would like to meet you."'
```

If a parameter represents a file name you should keep in mind that file names on AmigaOS might contain spaces or other special characters which will cause ARexx to treat the name as multiple words instead of a single word. Hence a file name should **always** be surrounded by quotes, no matter if it contains spaces or not. Scripts can very easily be tested for this case by letting them handle a file in the Amiga RAM disk, i.e. "RAM Disk:/foo/bar".

### RETURNS

Returned info to be expected from the command. Commands may return results in three different kinds; let's look at these examples which use the FOLDERINFO command:

#### FOLDERINFO

```
-> RESULT = "0 Incoming incoming 10 2 4 23030 1"
```

#### FOLDERINFO VAR fi

```
-> fi = "0 Incoming incoming 10 2 4 23030 1"
```

```
FOLDERINFO STEM fi.
-> fi.number = 0
   fi.name = "Incoming"
   fi.path = "incoming"
   fi.total = 10
   fi.new = 2
   fi.unread = 4
   fi.size = 23030
   fi.type = 1
```

Another example which returns a result of type /M:

```
ADDRFIND STEM found. "Marcel Beck" NAMEONLY
-> found.alias.count = 2
   found.alias.0 = "Mars"
   found.alias.1 = "mbe"
```

#### WARNING

Any sort of vital information you should be aware of when using this command.

#### NOTES

Various notes about the command.

#### EXAMPLE

A fragment of ARexx code to illustrate the usage of the command.

#### BUGS

Problems that are known or have already been fixed with this command.

#### SEE ALSO

Links to other related commands.

## List of all the ARexx commands sorted by function

### Commands supplied by MUI

[HELP](#) - Return a list of all the supported ARexx commands  
[HIDE](#) - Iconify YAM  
[INFO](#) - Return information about the program  
[QUIT](#) - Terminate YAM  
[SCREENTOBACK](#) - Bring the YAM screen to the background  
[SCREENTOFRONT](#) - Bring the YAM screen to the foreground  
[SHOW](#) - Uniconify YAM

### Address book handling

[ADDRDELETE](#) - Remove an entry from the address book  
[ADDREDIT](#) - Fill the fields of the current address book entry  
[ADDRFIND](#) - Search the address book for one or more entries  
[ADDRGOTO](#) - Select an address book entry by alias  
[ADDRINFO](#) - Return information about an entry referred by alias  
[ADDRLOAD](#) - Load an address book by filename  
[ADDRNEW](#) - Create a new entry in the address book  
[ADDRRESOLVE](#) - Resolve an alias or name  
[ADDRSAVE](#) - Save the address book under a given filename

### Folder wide operations

[FLUSHINDEXES](#) - Flush the index of all folders  
[FOLDERINFO](#) - Return information about a given folder  
[GETFOLDERINFO](#) - Return information about the current folder  
[MAILFILTER](#) - Filter messages in the current folder  
[MAILUPDATE](#) - Update the index of the current folder  
[NEWMAILFILE](#) - Return a free message slot for a given folder

**GUI handling**

[APPBUSY](#) - Switch YAM to busy mode  
[APPNOBUSY](#) - Bring YAM out of busy mode  
[LISTFREEZE](#) - Forbid graphical updates to a list  
[LISTUNFREEZE](#) - Permit graphical updates to a list  
[READCLOSE](#) - Close the active Read window  
[RESTART](#) - Restart YAM

**Message/Folder selection**

[FINDMAIL](#) - Find a mail in all folders given a MessageID  
[GETSELECTED](#) - Get the position of the messages selected in the current folder  
[LISTSELECT](#) - Select messages in the current folder  
[SETFOLDER](#) - Select the current folder  
[SETMAIL](#) - Select the current message in the current folder by number  
[SETMAILFILE](#) - Select the current message in the current folder by filename

**Message manipulation**

[GETMAILINFO](#) - Return information about the active message  
[MAILARCHIVE](#) - Move the selected messages to another folder  
[MAILBOUNCE](#) - Bounce the current message  
[MAILCHANGESUBJECT](#) - Change the subject of the selected message(s)  
[MAILCOPY](#) - Duplicate the selected message(s)  
[MAILDELETE](#) - Delete the selected message(s)  
[MAILEDIT](#) - Edit the current message  
[MAILEXPORT](#) - Export the selected message(s) into a file  
[MAILIMPORT](#) - Import messages from a file into the current folder  
[MAILINFO](#) - Return information about a given message  
[MAILMOVE](#) - Move the selected messages to another folder  
[MAILREAD](#) - Read the current message  
[MAILREPLY](#) - Reply the currently selected messages  
[MAILSTATUS](#) - Change the status of the selected message(s)  
[READINFO](#) - Get info about the attachments in the message being read  
[READPRINT](#) - Print an attachment  
[READSAVE](#) - Save an attachment  
[SETFLAG](#) - Set the PERmanent or VOLatile flag of a message

**Network related**

[GETURL](#) - Download a file from the WWW based on a given URL  
[ISONLINE](#) - Detect whether YAM is currently transferring email  
[MAILCHECK](#) - Download new email  
[MAILSEND](#) - Send the messages in the **Outgoing** folder  
[MAILSENDALL](#) - Send all the messages in the **Outgoing** folder

**Request info from user**

[GETCONFIGINFO](#) - Return information about the current user  
[REQUEST](#) - Request a choice from the user  
[REQUESTFILE](#) - Request the user to select a file  
[REQUESTFOLDER](#) - Request the user to select a folder  
[REQUESTSTRING](#) - Request the user for a string  
[USERINFO](#) - Return information about the current user

**Writing new email**

[MAILFORWARD](#) - Forward the selected messages  
[MAILWRITE](#) - Open a new Write window to compose a new mail  
[WRITEATTACH](#) - Attach a file to a new message  
[WRITEBCC](#) - Fill the BCC: header of a new message

[WRITECC](#) - Fill the CC: header of a new message  
[WRITEEDITOR](#) - Pass an ARexx command to the internal editor  
[WRITEFROM](#) - Fill the FROM: header of a new message  
[WRITEIDENTITY](#) - Choose the user identity to be used when composing a new mail  
[WRITELETTER](#) - Load a file into the internal text editor  
[WRITEMAILTO](#) - Fill the TO: header of a new message  
[WRITEOPTIONS](#) - Set the options of a new message  
[WRITEQUEUE](#) - Move a new message to the **Outgoing** queue  
[WRITEREPLYTO](#) - Fill the REPLY-TO: header of a new message  
[WRITESEND](#) - Send a new message  
[WRITESUBJECT](#) - Fill the SUBJECT: header of a new message  
[WRITETO](#) - Fill the TO: header of a new message
