Are there any chances to see YAM being ported to other GUI systems such as Reaction?

Even if it would be a nice opportunity for YAM to be available for other GUI systems than just MUI, chances are more or less zero to see it ever be ported to something that isn't at least compatible or derived from MUI. Not only would it take a very large amount of time to adapt it to other GUI systems, which in fact would certainly end up in a complete rewrite from scratch, but there doesn't exist any other GUI system on AmigaOS which is as feature rich and flexible as MUI.

Even the advanced Reaction classes supplied with AmigaOS4 won't allow to convert all current functionality in YAM over to a Reaction GUI. And then, YAM uses numerous third-party MUI custom classes such as TextEditor.mcc, NList.mcc and so on which are not or only partly available as e.g. Reaction classes. In addition, MUI is so flexible that you can very easily tune its look&feel to be pretty much the same like the GUI system you normally use. And another point is that all current Amiga platforms come with at least a MUI compatible GUI toolkit (AmigaOS3, AmigaOS4, MorphOS, AROS) so that YAM can be very easily maintained as a multi-platform email program by just using MUI.

So we currently don't really see a possibility or reason to port YAM to any other GUI system available to AmigaOS-based computer systems. MUI is still the most advanced, flexible and available GUI toolkit for any Amiga platform.
